

# PROGRAMMING LANGUAGE REFERENCE CARD

## STATEMENT FORMATS

```
/* comments in C are enclosed by slash-star and star-slash */
int i;
tmp = a; a = b; b = tmp;
if (a < 0) a = -a;
else printf ("was plus \n");
while (i < MAX) a[i++] = 0;
for (i = 0; i < MAX; i++) a[i] = 0;
do c = getchar(); while (c == ' ');
switch (getchar()) {
case 'X': exit (0);
case 'H': help (); break;
case 'A': case 'B': argn; break;
default: printf ("try again \n");
}
break;
continue;
return A;
goto error;
error: printf ("INVALID FRAMUS\n"); exit(1);
```

simple statements are terminated with a semicolon  
statements may have null body  
compound statements are within braces  
and used wherever a simple statement is allowed  
perform statement if condition is true  
optional else after if  
perform statement while condition is true  
perform initialization once, then  
statement and increment while condition is true  
perform statement until condition  
false, test done at bottom of loop  
evaluate expression and goto  
appropriate case statement  
if no break would fall into next case  
multiple cases allowed  
default if no case matched  
end switch  
terminate smallest enclosing while, do, for, or switch  
goto bottom of loop in while, do, or for  
exit function and return optional expression to caller  
unconditional jump to statement preceded with label  
label marks statement

## PREPROCESSOR COMMANDS

```
#define TRUE 1
#define NEG(x) (-x)
#ifdef DEBUG
# if MODE == 1
# else
# endif
#include "local.h"
#include <stdio.h>
#line 100 test3
```

substitute optional string for identifier  
substitute expanded macro for identifier  
forget previous define  
compile if constant expression is true  
compile if identifier is defined  
compile if identifier is not defined  
compile if previous if condition false  
terminates conditional compile  
replace this line with contents of file  
replace this line with contents of system file  
renumber and optional rename for diagnostic printouts

## CONSTANTS

1234	decimal number	1234L	long decimal number
0xaa55	hexadecimal number	0xaa55L	long hexadecimal number
0177	octal number	0177L	long octal number
32.5	float number	1.2e-5	scientific notation
'a'	character	"abcd"	null terminated string

## SPECIAL CHARACTERS

'\n'	newline	'\r'	carriage return
'\t'	tab	'\f'	form feed
'\b'	backspace	'\s'	backslash
'\''	single quote	'\ddd'	octal constant

## VARIABLE DECLARATIONS

```
char a;
int i, j, k;
long sum;
short x, y;
unsigned limit - 0xffff;
float matrix[10][50];
double big;
char *ptr;
extern int flag, open ();
static char here_to_stay;
auto long amnesia;
char msg[] = "HELP \n";
struct name {
char first[10];
char last[20];
unsigned sex : 1;
} employee;
union kludge {
char c;
float f;
} mixed;
typedef char *string;
```

signed, one byte  
signed integers  
signed large integer  
signed small integers  
unsigned integer, initialized  
two dimensional array of floating points  
large floating point  
variable ptr points to data of type char  
advises that variable is often used  
variable and function in other modules  
local permanent storage  
dynamic storage, default for function variables  
definition of complex data type, name  
with members, employee, first,  
employee, last,  
and the bit field employee, sex  
declaration of variable employee of type struct name  
defines an overlay of different data types  
the member mixed.c shares its storage area  
with the longer member mixed.f  
declaration of a variable mixed  
creates a new variable type name, string

## OPERATOR PRECEDENCE

PRIMARY EXPRESSION				LEFT TO RIGHT			
()	{} []	.	→				
function	array element	structure member	structure pointer				
UNARY OPERATORS				RIGHT TO LEFT			
indirect	address	minus	negate	's comp	inc	dec	sizeof () cast
BINARY OPERATORS				LEFT TO RIGHT			
* multiply	/ divide	% modulus					
+ add	- subtract						
<< shift left	>> shift right						
< less than	> greater than	<= less or equal	>= greater or equal				
= equals	!= not equals						
& bitwise and							
bitwise or							
^ bitwise exclusive or							
&& logical and							
logical or							
CONDITIONAL EXPRESSION				RIGHT TO LEFT			
condition ? true : false							
ASSIGNMENT OPERATORS				RIGHT TO LEFT			
= += -= *= /= %+= >>= <<= &= ^=  =							see BINARY OPERATORS
COMMA OPERATOR				LEFT TO RIGHT			
,							discards value of left expression

## FORMATTED I/O

```
printf (format, exp1, exp2, ...)
fprintf (stream, format, exp1, exp2, ...)
sprintf (buffer, format, exp1, exp2, ...)
scanf (format, addr1, addr2, ...)
fscanf (stream, format, addr1, addr2, ...)
sscanf (buffer, format, addr1, addr2, ...)
```

to standard output  
to specified output  
to string buffer  
from standard input  
from specified input  
from string buffer

Note that destination addresses are required by scanf, fscanf, and sscanf

Format string consists of text to be printed or matched containing format specifiers.

A format specifier has the form:

% [-] [u] [W] [M] [I] <conversion character>

where:

- forces left justification (printf only)  
assignment suppression (scanf only)  
W width in characters (leading 0 means zero pad)  
M precision (printf only)  
I letter I - specifies long integer or double

conversion characters:

d signed decimal integer  
u unsigned decimal integer (printf only)  
x unsigned hexadecimal integer  
h unsigned short integer (scanf only)  
o unsigned octal integer  
c single character  
s null terminated string  
f fixed point notation for float or double  
e scientific notation for float or double (printf only)  
use %e or %f, whichever is shorter (printf only)

## UNIX\* I/O CALLS

Note: unless specified below, arguments and return values are int's.

```
char buffer[];
char *name;
*ptr;
*stream;
open (name, mode);
read (filedes, buffer, count);
long lseek (filedes, offset, from);
creat (name, mode);
FILE * fopen (name, s_mode);
FILE * freopen (name, s_mode, stream);
fread (ptr, item_size, count, stream);
fwrite (ptr, item_size, count, stream);
getc (stream);
putc (ch, stream);
lseek (stream, offset, from);
```

0: read, 1: write, 2: both  
write (filedes, buffer, count);  
1: current, 2: end  
close (filedes);  
"r": read, "w": write, "a": append  
FILE \* fdopen (filedes, s\_mode);  
FILE \* gets (buffer);  
puts (buffer);  
getchar ();  
putc (ch);  
fclose (stream);
